

**LOT 3.**  
**STOCKYARD CREEK**, unsettled district, Darling Downs, Queensland, is permanently watered, situated in the unsettled district of the Darling Downs, but adjoining Goodlands, on the north, embraces a large area of land, and is a fine, open, smooth country, about 12 miles long by about 7 miles wide, and is permanently watered throughout its entire length by the Stockyard Creek.

**THE IMPROVEMENTS** on this run are sheepfolds, and a large number of sheep are now being reared and fattened on it, or could be worked in conjunction with the AUBURN or any of the Western Downs runs.

**THE CATTLE** are sold without stock. Estimated capabilities, 8000 sheep.

**THE ABOVE RUNS** are all held under 31 years' leases from 1st July, 1860, at fair rentals, and the owners desire all surveys and undisputed. They are all in the unsettled districts of Queensland, and are not liable to selection.

**THESE VALUABLE** properties are now in the market for **IMPERATIVE SALE**, as the auctioneers are required by the Government to dispose of the same to realise his estate. These stations have been remunerative to their late owner, and intending purchasers will find them a most desirable and profitable investment. They are situated on the station, enclose, satisfy themselves of their thoroughness as regards water, and other improvements.

**TERMS**—One-third cash; a balance by promissory notes at one, two, and three years, at 7 per cent. interest secured by a mortgage.

An early application is invited.

For further particulars, please, &c., apply to  
**G. GRANGE, Auctioneer.**

and when people stay a long time, must be set the expense of setting up a establishment. The other cost of furnishing furniture, plate, &c., on which these articles are provided; taxes, and waste of servants, which are high as place. Thinking, therefore, as we are, sweet home, is a reason, perhaps, in the present day, we strongly wish young couples who reside in large towns to eschew the delusive idea of their own home, and by taking up a hotel to cast from their shoulders annoyances which prevent the honeymoon, and put a speedy end to it.

**TOT OF CONVERSATION.**

### HOMES OR HOTELS.

[illegible]

A NUMEROUSLY attended meeting of the chemical section of the Society of Arts was held at the society's

house, Fifth-street, Adelphi.—Professor Tyndal, D.C.L., F.R.S., in the chair.

The members of the Metropolitan Fire Brigade, read a paper on "Appliances for Combating Typhens to Breathe in Dense Smoke or Poisonous Vapours," in which, after pointing out that the great danger to firemen had to contend with smoke, and those attending to the injured with its mephitic gases, he described some of the best known appliances for enabling a man to enter into and remain in a place strongly impregnated with noxious gases. He then described the breathing apparatus for the fireman, in bag and short tubes, in canvas jacket, and in a respirator, which would act as a filter and intercept the grosser particles of the smoke, and Chevalier Aldini's improved clothing. The main subject of the paper was the apparatus for the rescuer, consisting of a cap, an apparatus which is light, portable, and free from the disadvantages attaching to most of the other inventions which were alluded to. The cap is partially inflated with air, and provides for the mouth a light, closely-fitting filter, and valve, and for the eyes a complete cover, which will act as a protection without obstructing the sight, the whole being capable of being put on and adjusted for use in a few seconds, and it is by its use that the rescuer can aid him at any one place. It should be strong and fit for rough work, and also it should contain no delicate parts liable to get out of order, and no material parts incalculably liable to be injured by the action of the elements have hitherto constituted very serious difficulties, but the specimens exhibited by Captain Shaw showed that they are now to a great extent, if not altogether, overcome. The cap, which separates the smoke or smoke or noxious vapours, from the face, constitutes the speciality of the apparatus, as the invention of Professor Tyndal, who has placed it at the disposal of the Fire Brigade without fee or reward, is a kind of hood, which is composed mainly of two parts, called respectively the hood and the respirator. The hood is made of the best-dressed pulch blacked, cut in sections and closed with air-tight joints, and is made of a material of the thickness of half an inch, and the sections strongly sewn together with two separate rows of saddle stitching. The skull part is fitted to the shape of a man's head, and underneath the face is a circular opening 2 inches deep forming a collar, to the lower edge of which there is attached a kind of apron-piece, shaped to fit a man's chest and shoulders under a tunic. The cap is fitted with eye-glasses and a brass mouth-piece, a valve, and a filter. The cap is composed of two parts, the valve chamber and the filter tube. The charge for the filter consists of half

At a meeting of the Association of British Musicians

interesting paper was read, by Mr. J. Balfour Hamilton, on the application of wind to stringed instruments.

His introduction began by showing that one of the most ancient sounds was produced by the application of wind to string, viz. in the form of the *Eolian harp*, which was known to the ancient Greeks. The note of the *Eolian harp* is, at times, of a very peculiar character, and is incapable of being controlled. The reason of this is, that the harp consists of one or more strings placed in a wide frame through which a draught played, the current of air being so regulated as to produce a peculiar effect, with little effect from not being concentrated on a string. Mr. Hamilton then described the various attempts which had been made to improve the *Eolian harp* by narrowing the frame, and by directing the wind on the string by means of bellows. These attempts, from various causes, failed. They were, however, steps in the right direction, and led Mr. John Farmer, of Liverpool, to the construction of an instrument, in which the wind, instead of passing to the end of a reed, and causing the wind to act on the string through the reed. This idea was a good one, but the difficulty was to work it. The vibrations of the reeds are dissipated, and the vibrations of the strings are difficult to sustain, unless he could get his reed to vibrate in such a manner as not to attach the string. Fortunately, he managed to hit on the right form of box on which the reed would vibrate outwards, and thus he succeeded in making the reed vibrate in such a manner as not, however, to destroy the plaintive sweetness of the string to the power and sustaining capabilities of wind. At this time he succeeded in explaining the importance of the discovery, and set himself to work it out. Little did he imagine the difficulty and the magnitude of the undertaking which he was about to enter. He commenced his work about six months, but he made little progress. At times his experiments were crowned with a little success; he heard for a moment a sound so surpassingly sweet, that he was almost overcome by it, and then, reentering in, and then it would vanish, and harsh and discordant sounds would proceed from his combinations instead of soft replete notes; and, worse still, instead of the deep base note there would be a shrill, almost piercing note, and then would follow a wailing cry, a wailing cry, a wailing cry. Mr. Hamilton saw that either the thing must be given up, or he must acknowledge that he had failed, or he must devote his undivided energies to it. Without hesitating a moment, he sacrificed his affairs and established himself in London.

There he continued his experiments, but only to meet with continued disappointments. He found that the strings, instead of giving out their fundamental notes, separated themselves into segments divided off by points of rest or nodes, and gave out over-tones, and harmonics, and all kinds of sounds but the right ones. The difficulty was to get the strings to vibrate by the string, and the pitch of its note was altered. These difficulties were the means of setting him in the right way. After much thought he arrived at the true theory, and found the way to the right sound. The theory was this: the reed, as in the reed-pipe of an organ, gave the initial sound; in an organ this sound is multiplied and reinforced by pipes, and in the *Eolian harp* the sound is multiplied and reinforced by the strings. The ob-

THE NEW KING OF SPAIN.—The *Examiner* satirically observes:—The fact that Alfonso XII. as he must be called, for however brief a period—received part of his education at Sandhurst would seem to have opened his eyes to the value of the British system of military training in England. We are quite proud because a future king was sent to school here; it is another compliment to our glorious institutions: it fastens our national vanity upon the young monarch, and tends to lead him to his duties. We trust that Alfonso XII. has profited sufficiently by his studies at Sandhurst to be able to perform the first and best commendation for a Constitutional King—namely, to be quiet and obedient. We are glad when he is told to. The only thing that inspires us with misgivings as to his future is that he is said to have "an intelligent look." That is a very dangerous thing for a constitutional monarch to have. The only thing that looks somewhat ominous is that in an interview with the Paris correspondent of the *Standard*, he is reported to have "thanked the Conservative press, and announced his intention to 'found a new political party.'" It would be somewhat difficult, we presume, for a boy of seventeen to found institutions similar to ours—a monarch who reigns but does not govern; a House of Lords whose functions are restricted to a mere negative; a House of Commons elected by household suffrage—the dogs of the populace! And what thanks are due to the Conservative Press for these institutions? The most visible of them is the *Standard* itself. It is founded and controlled by the Conservative Press: its success is measured by the Conservative Press: its failure, perhaps, however, Alfonso XII.'s views have been slightly coloured by the *Standard's* correspondent: for to the *Standard* we are indebted for the assurance that he meant to "favour Liberal Constitutionalism, with the toleration of religious non-conformity."
